

WHAT IS DOCKER?

WHY EVERY WEB DEVELOPER SHOULD USE DOCKER?

What is Docker?

- Docker is a platform that allows you to package applications and their dependencies into containers.
- Docker containers allow you to encapsulate your application and make its portability easier from one location to another.
- Think of it as a physical container that is used to transport goods from one part of the world to another.
- Docker containers provides isolation so that your application can run without any conflicts.

Why every web developer should use Docker?

- Ensures that your application runs everywhere and makes deployment seamless.
- Environment setup is simpler.
- Reduces bugs during development.
- Easy to share your application with other team members.
- Widely used and supported across different platforms.
- Provides you a competitive edge as a web developer.
- and much more.
